

Split-level Dispatch Console

Our Split-level workstations start with a robust equipment enclosure base. Unlike the dual table systems provided by Xybix, Watson and Bramic, Americon workstations do not use unsightly metal table legs to lift the worksurfaces nor do they need partitions to hide cables and power cords. We have replaced this ancient paradyne with a more function and user-friendly base system that does much, much more without compromising leg room.

The Americon Advantage

- The equipment base houses all lifting motors and under surface hardware needed to lift the worksurfaces.
- The monitor and input surface are each actuated by four strategically located hydraulic pistons to eliminate surface that may caused deflection due to uneven weight distribution. Table systems only have two lifting columns per surface normally on the ends that utilize separate linear actuators which are prone to adjustment problems. Each surface has a lifting capacity of 750 lbs.
- The base has a segregated power/data/voice cable management system and can even have EIA racks.
- The two separate lifting surfaces are only offset from each other by an 1/8". Unlike table systems that require a large gap between worksurfaces, there is no place for pencils and pens to fall through.
- The base has a storage for up to four full-height CPU towers that eliminates the need for extra CPU storage cabinets where real estate is at a premium .
- The base equipment enclosure has access both front and rear through hinged access doors.

- Unlike table systems, monitor cables and power cords pass through the monitor shelf to the base through metal shafts that protect and hide them from view. This eliminates accordian style cable relief found in table systems that shows under foot.
- The base is freestanding and has passthroughs to freestanding adjacent components.
- The complete workstation is freestanding and finished completely inside and out.
- All Americon products are clad in a spaceage proprietary laminate that hermetically seals all components from the effects of temperature and moisture. The proprietary system eliminates the need for unsightly bumper molding on freeformed detail edges.
- All Americon dispatch console systems include adjustable leveling glides.

Accessories

A continuous slatwall is available that mounts monitor arms, task lights, phone mounts, storage trays and other accessories. Unlike furniture systems that rely on cubicle style stationary floor panels, the Americon slatwall is attached to the rear worksurface providing noise suppression even in the standing position. Each surface moves independently and there is plenty of room on the rear surface for monitors on stands when workstation is ordered without a slatwall.

The sit/stand height levels can be controlled through switches embedded in the input surface or from our Personal Workspace Manager that supplies forced air heating and filtered desktop ventilation.

Split-level consoles are available in straight, concentric arc and cockpit style configurations. The freestanding base is expandable by adding stationary modules which can be storage cabinets, file cabinets, CPU enclosures, fax and printer cabinets, drawer

pedestals, shelving, bookcases and additional lengths of stationary worksurface to increase the work area.

A myriad of accessories are available such as monitor arms, phone mounts, speaker turrets, communications hubs, personal environmental systems, LED task lights, paper trays, cup holders and manual trays. All Americon products carry a three year limited warranty for materials and workmanship. All dispatch workstations and accessories meet or exceed ANSI/BIFMA standards.
